Just Accepted

“Just Accepted” manuscripts have been peer-reviewed and accepted for publication. They are posted online prior to technical editing, formatting for publication and author proofing. The American Chemical Society provides “Just Accepted” as a service to the research community to expedite the dissemination of scientific material as soon as possible after acceptance. “Just Accepted” manuscripts appear in full in PDF format accompanied by an HTML abstract. “Just Accepted” manuscripts have been fully peer reviewed, but should not be considered the official version of record. They are citable by the Digital Object Identifier (DOI®). “Just Accepted” is an optional service offered to authors. Therefore, the “Just Accepted” Web site may not include all articles that will be published in the journal. After a manuscript is technically edited and formatted, it will be removed from the “Just Accepted” Web site and published as an ASAP article. Note that technical editing may introduce minor changes to the manuscript text and/or graphics which could affect content, and all legal disclaimers and ethical guidelines that apply to the journal pertain. ACS cannot be held responsible for errors or consequences arising from the use of information contained in these “Just Accepted” manuscripts.

ABSTRACT

Herein we report the discovery of a series of new PCAF bromodomain (BRD) inhibitors, which were obtained through a hit discovery process and subsequent structure-based optimization and structure-activity relationship (SAR) analyses towards a retrieved hit compound (**12**). Among these inhibitors, (*R,R*)-**36n** is the most potent one with an IC₅₀ of 7 nM in HTRF assay and a K_D of 78 nM in ITC assay. This compound also exhibited activity against GCN5 and FALZ, but weak or no activity against other 29 BRD proteins and 422 kinases, indicating considerable selectivity. X-ray cocrystal structure analysis revealed the molecular interaction mode and the precise stereochemistry required for bioactivity. Cellular activity, preliminary RNA-seq analysis and pharmacokinetic properties were also examined for this compound. Collectively, this study provides a versatile tool molecule to explore molecular mechanisms of PCAF BRD regulation and also offers a new lead compound for drug discovery targeting PCAF.

1. INTRODUCTION

Bromodomains (BRDs) are highly conserved epigenetic “reader” protein modules that recognize ϵ -*N*-acetylated lysine marks on proteins,¹ and play a key role in the epigenetic regulation of gene transcription. A total of 61 BRDs are identified in the human proteome, which present in 46 diverse proteins.² Among these BRDs, BET (Bromo and extra-terminal) BRDs are the most extensively studied subfamily (subfamily II of BRD phylogenetic tree). A large number of selective and potent BET BRD inhibitors have been discovered,^{3,4} which have provided versatile tools for bio-functional studies, and further led to numerous translational studies on this subfamily of BRD proteins.⁵⁻⁹ In contrast, BRDs in non-BET subfamilies have received less attention. Biological functions of many non-BET BRDs in physiological and pathological conditions are still not clear, and inhibitors of these BRDs are also much less.¹⁰⁻¹²

P300/CBP-associated factor (PCAF), also known as lysine acetyltransferase 2B (KAT2B), is a BRD-containing protein, which belongs to subfamily I of the BRD phylogenetic tree.¹ PCAF is a multidomain protein including an acetyltransferase (HAT) domain,¹³ a *N*-terminal E3 ubiquitin ligase domain,¹⁴ and a C-terminal bromodomain,¹⁵ which has been implicated in a number of disparate disease pathologies and small molecule modulators have great potential as therapeutics.¹⁶ Regulation mechanisms and roles in diseases of these domains, particularly the C-terminal bromodomain, are far from understood. Small molecule inhibitors might provide tool molecules to unravel the functions of the PCAF BRD on the one hand, on the other hand, offer potential lead compounds for drug development targeting PCAF BRD.

To date, a number of small molecular inhibitors of PCAF BRD have been reported, which are summarized in Figure 1. Zeng et al. reported the first PCAF inhibitor **1**, which could disrupt the PCAF-BRD/Tat-AcK50 interaction in vitro.¹⁷ Subsequent structural

1
2
3 optimization of **1** generated a more potent compound **2**.¹⁸ Navratilova et al.¹⁹ and
4
5 Chaikuad et al.²⁰ separately used fragment-based screening approaches to identify
6
7 PCAF BRD inhibitors, and a number of inhibitors (fragments) were retrieved, for
8
9 example, compound **3** and **4**. In 2016, Genentech and Constellation disclosed potent
10
11 dual PCAF/GCN5 BRDs inhibitors in three patents, and compounds **5-7** shown in
12
13 Figure 1 are representative ones although no selectivity data was reported.²¹⁻²³ Later,
14
15 Brennan and coworkers reported a [1,2,4]triazolo[3,4-a]phthalazine derivative, **8** (**L-**
16
17 **Moses**, Figure 1) as a potent, selective, and cell active PCAF probe.²⁴ Researchers from
18
19 GlaxoSmithKline published a potent PCAF/GCN5 BRDs inhibitor **9**,²⁵ and very
20
21 recently, they further derived a PROTAC compound (GSK699) from **9**.²⁶
22
23
24
25

48 **Figure 1.** Representative PCAF BRD inhibitors publicly reported.

49
50
51
52 Despite these recent advances, there are still very few reported potent and selective
53
54 PCAF BRD inhibitors. The aim of this investigation was to identify more novel potent
55
56 and selective PCAF BRD inhibitors. To achieve this goal, we first performed virtual
57
58 screening (VS) against an in-house chemical database to retrieve hit compounds, which
59
60

led to the discovery of three hits. The most potent hit compound, which contains a new pyrrolo[3,2-d]pyrimidin-4-one scaffold, was then selected for subsequent structural optimization. Structure-activity relationship (SAR) analyses resulted in the discovery of a series of new PCAF BRD inhibitors containing the scaffold pyrrolo[3,2-d]pyrimidin-4-one. For the most active compound, further investigations including selectivity profiling, ligand-receptor interaction analysis, cellular activity, preliminary RNA-seq (RNA-sequencing) analysis and pharmacokinetic studies were carried out.

2. RESULTS AND DISCUSSION

2.1. Retrieving of Hit Compounds

To discover more potent PCAF BRD inhibitors with new scaffolds, we first conducted a virtual screening (VS) study against an in-house chemical database (details for the VS see Supporting Information Figure S1). Selected hit compounds in VS were then subjected to a differential scanning fluorimetry (DSF) assay at a compound concentration of 20 μM . Compounds with a thermal shift (ΔT_m) of ≥ 1 $^\circ\text{C}$ in the DSF assay were then validated by isothermal titration calorimetry (ITC) assay. We finally obtained three weakly active compounds, **10**, **11**, and **12**, which showed K_D values of 45, 7.8 and 2.4 μM in the ITC assay, respectively (Figure 2). Compound **10** shows some similarity to previously reported BRD7/9,²⁷ BAZ2A/B,²⁸ and CBP/EP300^{29, 30} BRD inhibitors and compound **11** contains the previously reported phthalazinone scaffold,²² but compound **12** harbors a new scaffold, pyrrolo[3,2-d]pyrimidin-4-one, which has not been reported previously in BRD inhibitors. We chose compound **12** to conduct further structural optimization because it is the most potent compound and has a novel scaffold.

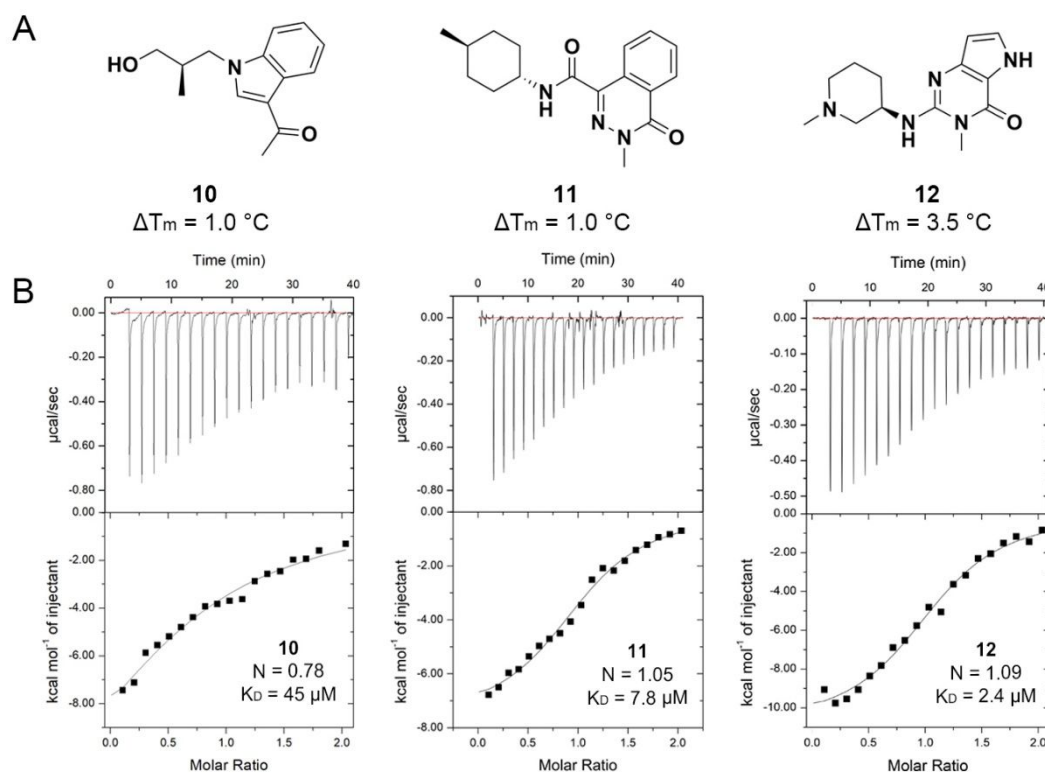

Figure 2. Three active compounds found by VS and subsequent bioactivity evaluation. (A) Chemical structures of **10**, **11**, and **12**. (B) Isothermal titration data of the interaction of hit compounds (for **10** and **11**, 500 μM ligand and 50 μM PCAF BRD were used; for **12**, 200 μM ligand and 20 μM PCAF were used) with PCAF BRD.

To facilitate the following structural optimization of **12**, an X-ray cocrystal structure of PCAF in complex with **12** was solved with a resolution of 2.1 Å resolution (PDB ID: 6J3O). As shown in Figure 3, compound **12** bound to the acetyllysine-binding site and had well defined by electron density. This compound forms hydrogen bonds with four amino acids, Pro747, Asn803, Tyr760, and Tyr809, either directly or via water-mediated interaction. The methyl substituent at the 3-position was in the water channel occupied by the acetyl lysine of the histone ligand. We also observed a π - π stacking interaction between the pyrrolo[3,2-d]pyrimidin-4-one core and the benzene ring of Tyr809. The basic piperidine group forms a salt bridge with acidic side chain of

Glu756, which is further stabilized by the backbone amide nitrogen of Lys753 through a hydrogen bond. Here it is necessary to mention that compound **12** seems to make the same interactions with PCAF BRD as compound (*R*)-**23** in reference 25, and the only difference is that compound **12** forms an additional hydrogen bond with Asn803.

2.2. Structural Optimization and SAR Analyses of Pyrrolo[3,2-d]pyrimidin-4-one Derivatives

Structural optimization of hit compound **12** was focused on three regions, namely, the 2-amino moiety (region I), the 3-position (region II) and the 5-position substituent (region III) of pyrrolo[3,2-d]pyrimidin-4-one (Figure 3C). A number of new pyrrolo[3,2-d]pyrimidin-4-one derivatives were designed and synthesized. Bioactivities of these compounds against PCAF BRD were measured by DSF and ITC assays.

Figure 3. Cocystal structure of PCAF/**12** guided the structural optimization. (A) Cocystal structure of compound **12** (yellow sticks) in complex with PCAF bromodomain (pale cyan cartoon) (PDB ID: 6J3O). Related residues are shown as

10 **2.2.1. Impact of 2-Amino Moiety (Region I)**

11
12 To explore the impact of 2-amino moiety of compound **12** on the bioactivity, we
13
14 varied region **I** and fixed region **II** and **III** with their original substituents. According
15
16 to the cocrystal structure of **12**-PCAF complex (Figure 3A), the basic *N*-methyl
17
18 piperidine in region **I**, which forms a salt bridge with acidic Glu756, plays an important
19
20 role to the ligand-receptor interaction. But the *N*-methyl piperidine group is not large
21
22 enough to occupy the ZA channel. Accordingly, all substituents used in region **I** were
23
24 required to contain a secondary or tertiary amine, and larger than *N*-methyl piperidine
25
26 to make potential interactions with Trp746 and Lys753. Based on this observation and
27
28 inspiration from the SAR study of compound **9**,²⁵ we designed and synthesized a total
29
30 of 10 compounds (*(R,R)*-**24a**, *(S,S)*-**24a**, *cis*-**24b**, *endo*-**24c-e**, *endo*-**25a**, *exo*-**25a**, and
31
32 *endo*-**26a-b**).

58
59
60

target products (*R,R*)-**24a**, (*S,S*)-**24a**, *cis*-**24b**, and *endo*-**24c-d**. **23** (*endo/exo* mixture) reacted with **16** to afford *endo*- and *exo*-**24e**. Acidic *N*-deprotection of *endo*- and *exo*-**24e** afforded *endo*- and *exo*-**25a**, respectively. *N*-alkylation of *endo*-**25a** with (*R*)-2-phenyloxirane or (*R*)-2-bromo-1-(pyridin-2-yl)ethan-1-ol produced *endo*-**26a-b**.

Scheme 1. Synthesis of (*R,R*)-**24a**, (*S,S*)-**24a**, *cis*-**24b**, *endo*-**24c-e**, *endo*-**25a**, *exo*-**25a**, and *endo*-**26a-b**^a

^a Reagents and conditions: (a) 1M NaOH (aq), 100 °C, 16 h, 90%; (b) Boc₂O, TEA, DMAP, DMF, rt, 82%; (c) iodomethane, NaH, anhydrous DMF, 40 °C, overnight; (d) trifluoroacetic acid, DCM, rt, 46% over two steps; (e) picolinic acid, HATU, DIPEA, DCM, rt, 83-88%; (f) iodobenzene, Pd(OAc)₂, Ag₂CO₃, 2,6-dimethylbenzoic acid, *t*-BuOH, 120 °C, 24 h, 62-77%, > 99% *ee*; (g) trifluoroacetic acid, DCM, rt; (h) 37% formaldehyde, NaBH(OAc)₃, AcOH, DCM, rt, 8 h, 84%; (i) NaOH, *i*-PrOH, 85 °C, 18

h, 78-85%; (j) **16**, primary amines, DIPEA, NMP, 150 °C, 2-5 h, 12-37%; (k) (*R*)-2-phenyloxirane or (*R*)-2-bromo-1-(pyridin-2-yl)ethan-1-ol, TEA, MeCN, 70 °C, overnight, 47-58%.

The synthesized compounds were assayed against the PCAF BRD and bioactivities of these compounds are presented in Table 1. (*R,R*)-**24a**, containing a (*R,R*)-1-methyl-5-phenylpiperidin-3-amino group, showed a thermal shift (ΔT_m) of 6.3 °C in DSF assay, and a K_D of 152 nM in ITC assay, whereas its enantiomer (*S,S*)-**24a** lost activity. *Cis*-**24b** with piperidine in (*R,R*)-**24a** replaced by azacycloheptane also displayed considerable activity in both assays ($\Delta T_m = 3.2$ °C and $K_D = 347$ nM), but relatively weaker potency compared with those of (*R,R*)-**24a**. Among the remaining seven compounds containing a bridged piperidine, *endo*-**24c** was the most potent one ($\Delta T_m = 7.3$ °C and $K_D = 0.215$ μ M). The *N*-methyl removal product *endo*-**25a** slightly decreased in bioactivity ($\Delta T_m = 6.6$ °C and $K_D = 0.242$ μ M), whereas the diastereomer *exo*-**25a** did not exhibit activity. *Endo*-**24e**, *endo*-**26a**, and *endo*-**26b** with a bulky substituent in the bridged piperidine displayed a significant reduced activity in both assays. *Endo*-**24d**, which contains a 2-carbon-bridged piperidine (tropane), showed no activity.

Table 1. Bioactivities of Region I Substituted Compounds against PCAF BRD.

<i>endo</i> - 26b		1.19	4.6 ± 0.3

^a Values are averages of triplicates ± SEM (2 μM PCAF, 10 μM compound).

2.2.2. Influence of 3- and 5-Position Substitutions (Region II and III).

To examine the influence of 3- and 5-position substitutions of pyrrolo[3,2-d]pyrimidin-4-one core, we fixed 2-position (region I) with its optimal group, *(R,R)*-1-methyl-5-phenylpiperidin-3-amino, and varied the 3- or 5-position substituents. Six new compounds (*(R,R)*-**32a-f**) were designed and synthesized (Scheme 2); for the 3-position substituents, we introduced unsaturated alkyl groups because it has been

reported that unsaturated alkyl groups at this position might influence the bioactivity or selectivity across bromodomains.³² Intermediate **15** underwent an alkylation reaction with various haloalkanes followed by Boc-deprotection gave **27a-d**. Methylation of **14** with methyl iodide afforded **28**. Selective hydrolysis of **29** with 1 M NaOH generated **30**, and methylation of **30** resulted in the formation of **31** in an excellent yield. Finally, **27a-d**, **28**, and **31** reacted with (*R,R*)-**20a** to produce (*R,R*)-**32a-f**, respectively.

Scheme 2. Synthesis of (*R,R*)-**32a-f**^a

^aReagents and conditions: (a) haloalkanes, NaH, anhydrous DMF, 50 °C, overnight, 34-78%; (b) trifluoroacetic acid, DCM, rt; (c) 1M NaOH (aq), 100 °C, 95%; (d) (*R,R*)-**20a**, DIPEA, NMP, 150 °C, 2 h, 13-47%.

Table 2 shows the bioactivities of these compounds. From Table 2, we can see that the longer the (unsaturated) alkyl chain of 3-position, the worse the bioactivity ((*R,R*)-**32a-d**), indicating that a bulky group at 3-position is unfavorable for bioactivity. To explore the impact of 5-position substitution of pyrrolo[3,2-d]pyrimidin-4-one, we firstly added a methyl group at 5-position. Bioactivity of the resulting compound (*R,R*)-**32e** decreased significantly, implying that the hydrogen bond (NH...O) is important and substitution at this position is not favored (see Figure 3A). Displacing the nitrogen

atom on 5-position with a sulfur atom ((*R,R*)-**32f**) also decreased the binding affinity, demonstrated again the importance of the hydrogen bond (NH...O).

Table 2. Bioactivities of Compounds (*R,R*)-**32a-f** against PCAF BRD.

Compd	R ²	K _D (μM)	ΔT _m (°C) ^a
(<i>R,R</i>)- 32a		0.621	4.8 ± 0.2
(<i>R,R</i>)- 32b		0.676	2.2 ± 0.6

(<i>R,R</i>)- 32d		3.04	1.5 ± 0.4
(<i>R,R</i>)- 32e		> 10	-0.2 ± 0.4
(<i>R,R</i>)- 32f		0.820	4.6 ± 0.4

^a Values are averages of triplicates ± SEM (2 μM PCAF, 10 μM compound).

2.2.3. Effect of Various Substituted 3-Amino-5-phenylpiperidine (Region I)

In preceding structural optimization, we obtained a potent compound, (*R,R*)-**24a**. SAR analyses indicated that any changes in region II and III were not favored for bioactivity improvement. We thus turned back to recheck region I, and examined the

1
2
3 possible effect of various substituents on the piperidine ring (R^3 and R^4). Fifteen
4
5 compounds ((R,R) -**36a-n** and (S,S) -**36n**) were synthesized.
6
7

8 Scheme 3 outlines the reaction routes for these compounds. Compound (R,R) - or
9
10 (S,S) -**18a** reacted with various aryl iodides via $C(sp^3)$ -H arylation to afford
11
12 enantiomerically pure (R,R) -**19a**, (R,R) -**33a-j** and (S,S) -**19a**.³¹ Compounds (R,R) -**19a**,
13
14 (R,R) -**33a-j** and (S,S) -**19a** were further converted to (R,R) -**34a-m** and (S,S) -**34m** by
15
16 Boc-deprotection and subsequent reductive amination or nucleophilic substitution.
17
18 Cleavage of the bidentate directing groups of (R,R) -**34a-m** and (S,S) -**34m** with the use
19
20 of NaOH/*i*-PrOH resulted in amines (R,R) -**35a-m** and (S,S) -**35m**, which were subjected
21
22 to S_NAr reaction with **16** to afford target products (R,R) -**36a-i**, (R,R) -**36k-n**, and (S,S) -
23
24 **36n**. Pd/C catalyzed debenylation of (R,R) -**36i** produced (R,R) -**36j**.

^a Reagents and conditions: (a) aryl iodides, Pd(OAc)₂, Ag₂CO₃, 2,6-dimethylbenzoic acid, *t*-BuOH, 120 °C, 24 h, 52-76%, > 99% *ee*; (b) trifluoroacetic acid, DCM, rt; (c) haloalkanes, TEA, MeCN, 80 °C, overnight, 76%; (d) 37% formaldehyde (aq), NaBH(OAc)₃, AcOH, DCM, rt, 73%; (e) NaOH, *i*-PrOH, 85 °C, 18 h; (f) **16**, DIPEA, NMP, 150 °C, 2 h, 11-26%; (g) (R,R)-**36i**, 10% Pd/C, H₂, MeOH, rt, 65%.

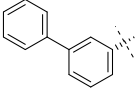

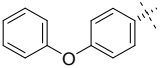

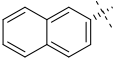

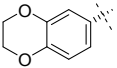

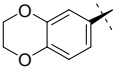

Bioactivities of these compounds are shown in Table 3. Increasing the size of *N*-alkyl substituent (R⁴) from methyl to allyl ((R,R)-**36a**), hydroxyethyl ((R,R)-**36b**), and phenethyl ((R,R)-**36c**) decreased the bioactivity. Meta- and/or para-substituted phenyl groups at R³ ((R,R)-**36d-l**) delivered potent activities, which are comparable to those of (R,R)-**24a**. (R,R)-**36m**, bearing a naphthalene-2-yl, enhanced the activity (K_D: 0.103 μM). (R,R)-**36n** with R³ substituted by 2,3-dihydro-1,4-benzodioxin-6-yl showed the

most potent activity among all the synthesized compounds (K_D : 0.078 μM , ΔT_m : 9.5 $^\circ\text{C}$) (Figure 4A and 4C). Of special note is that the enantiomer (*S,S*)-**36n** showed no obvious activity.

Table 3. Bioactivities of Compounds (*R,R*)-**36a-n** and (*S,S*)-**36n** against PCAF BRD

2.3. Validation of Top Active Compounds by Biochemical Assay

In the above SAR studies, DSF and ITC assays were used to measure the bioactivity of the synthesized compounds, and a number of active compounds were identified. Because both DSF and ITC belong to biophysical assay, we then used homogeneous time-resolved fluorescence (HTRF) assay, which is a biochemical assay, to further validate the bioactivity. Here just the top active compounds were tested. As shown in Table 4, all of the tested compounds showed high potency in the HTRF assay. (*R,R*)-**36n** is again the most active one with an IC₅₀ of 7 nM. For comparison, we also tested the bioactivity of *L-Moses*, which showed an IC₅₀ of 36 nM in the HTRF assay (Figure 4B).

Table 4. Biochemical Activities (HTRF, IC₅₀) of Compounds That Showed Potent Activity in ITC and DSF Assays.

Compd	IC ₅₀ (μM)	Compd	IC ₅₀ (μM)
(<i>R,R</i>)- 24a	0.041	(<i>R,R</i>)- 36i	0.014

<i>(R,R)-36h</i>	0.030		

Overall, the above structural optimization and SAR studies finally led to the discovery of compound *(R,R)-36n*, which is among the most potent PCAF BRD inhibitors currently reported. Subsequently, further studies including selectivity profiling, interaction mode analyses, cellular activity evaluation, preliminary RNA-seq analysis, and pharmacokinetic studies were conducted on *(R,R)-36n*.

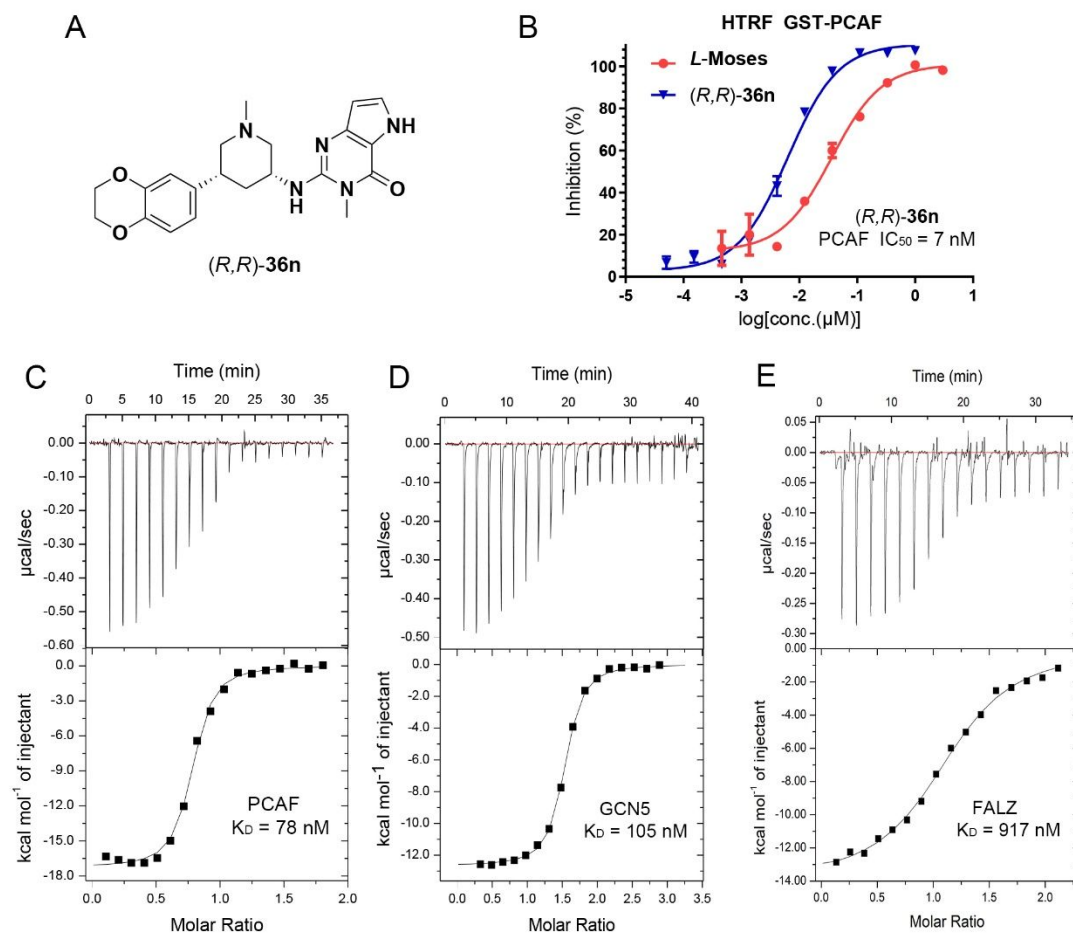

Figure 4. Identification of (*R,R*)-**36n** as a potent inhibitor of PCAF bromodomain. (A) Chemical structure of (*R,R*)-**36n**. (B) HTRF assays of (*R,R*)-**36n** and *L-Moses* on GST-PCAF. (C, D, E) ITC titration curves for the binding of (*R,R*)-**36n** (10 μM, 200 μL in cell) to PCAF (C, 100 μM, 40 μL in syringe), GCN5 (D, 160 μM, 40 μL in syringe) and FALZ (E, 125 μM, 40 μL in syringe).

2.4. Selectivity of (*R,R*)-**36n**.

To examine the selectivity of (*R,R*)-**36n**, we first used the DSF assay to measure activities of this compound against a panel of 12 BRDs available in our laboratory. (*R,R*)-**36n** showed the highest ΔT_m (9.5 °C) against PCAF. Besides PCAF, it also exhibited potent activity against GCN5 ($\Delta T_m = 7.3$ °C) and FALZ ($\Delta T_m = 5.3$ °C). To verify these activities, ITC was then used to determine the binding affinities of (*R,R*)-

36n against GCN5 and FALZ, which gave K_D values of 105 nM and 917 nM, respectively (Figure 4D and 4E). This is not strange because PCAF BRD, GCN5 BRD and FALZ BRD are highly homologous and share 69% sequence similarity. For the other 9 BRDs tested, (*R,R*)-**36n** displayed obviously weak or no activity (Figure 5A, Supporting Information Table S1).

Further, the commercial BROMOscan assay was used to test the activity of this compound against a panel of 32 BRDs. Consistent with the results from previous DSF assays, (*R,R*)-**36n** (1 μ M) showed potent activity against PCAF, GCN5, and FALZ. It also showed activity but much weaker against CECR2, BRPF, and BAZ2 families. For the remaining 23 BRDs, (*R,R*)-**36n** did not show activity (Figure 5B, Supporting Information Table S2).

In addition, we also tested the activity of (*R,R*)-**36n** against a panel of 422 kinases by Eurofins KinaseProfiler. Here a single concentration (10 μ M) of (*R,R*)-**36n** was used. The results showed that (*R,R*)-**36n** had no activity against all these kinases (see Supporting Information Table S3).

17 2.5. Interaction Mode of (*R,R*)-**36n** with its Receptor.

18
19 To understand the interaction mode of (*R,R*)-**36n** with PCAF BRD, we tried to
20
21 culture the cocrystal of (*R,R*)-**36n** with PCAF BRD. Unfortunately, it was unsuccessful
22
23 for some unknown reasons. We thus transferred to culture the cocrystal of (*R,R*)-**36n**
24
25 bound to GCN5 BRD. As shown in Figure 6, (*R,R*)-**36n** occupies the KAc (acetylated
26
27 lysine) binding site. Interactions found in the **12**-BRD complex (Figure 3A), including
28
29 hydrogen bonding, π -stacking interaction, and salt bridge, all exist in the (*R,R*)-
30
31 **36n**/BRD complex. Besides, we observed an additional edge-to-face aromatic
32
33 interaction between the 2,3-dihydro-1,4-benzodioxine group and Trp751 in the (*R,R*)-
34
35 **36n**/BRD complex, which may explain the higher activity of (*R,R*)-**36n** compared with
36
37 that of **12**.

2.6. Bioactivity of (R,R) -**36n** in Intact Cells.

The NanoBRET assay was adopted to assess the cell permeability and target engagement potential of (R,R) -**36n**.³³ HEK293T cells were co-transfected with NanoLuc-tagged full-length PCAF and Halo-tagged histone H3.3 (Promega). The tagged PCAF-histone interaction in intact cells could be disrupted by competition with the test compound. In this assay, (R,R) -**36n** showed clear dose-dependent displacement of full length PCAF-NanoLuc from histone H3.3-HaloTag in HEK293T cells with an IC_{50} of 118 nM, indicating that (R,R) -**36n** could pass through the cell membrane and target PCAF, whereas the enantiomer (S,S) -**36n** displayed no effect (Figure 7).

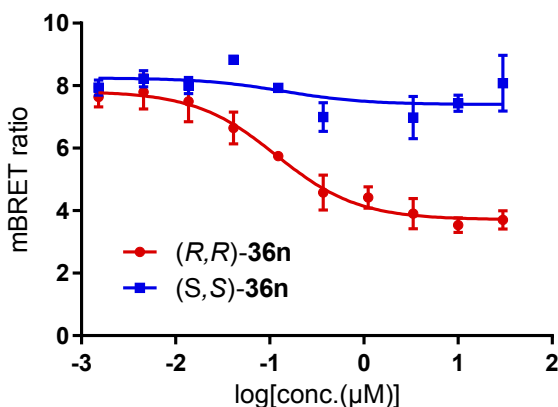

Figure 7. NanoBRET dose-response curves of (R,R) -**36n** and (S,S) -**36n** after 24 h treatment using *N*-terminal-nanoLuc-PCAF and *C*-terminal HaloTag-H3.3 in HEK293T cells (Graph represents $n = 2$ biological replicates).

2.7. Effect of (*R,R*)-36n on Global Gene Expression.

RNA-seq (RNA-sequencing) analysis was adopted to explore the effect of (*R,R*)-36n (2.5 μ M) on global gene expression. In this assay, (*S,S*)-36n (2.5 μ M) and DMSO were taken as negative and blank controls, respectively. Mouse embryonic fibroblast (MEF) cells were used. MEF cells were treated for 48 h in advance, and then collected for RNA-seq analysis. RNA from each set (n = 3) was used to analyze the global gene expression. As illustrated in Figure 8, treatment of (*R,R*)-36n significantly influenced the expression of 58 genes (> 1.5-fold), among which 49 genes (39 up-regulated and 10 down-regulated) were uniquely impacted by (*R,R*)-36n, which might be attributed to the role of PCAF/GCN5 BRDs. Even so, the biology significance of the gene up or down regulation needs further in-depth studies.

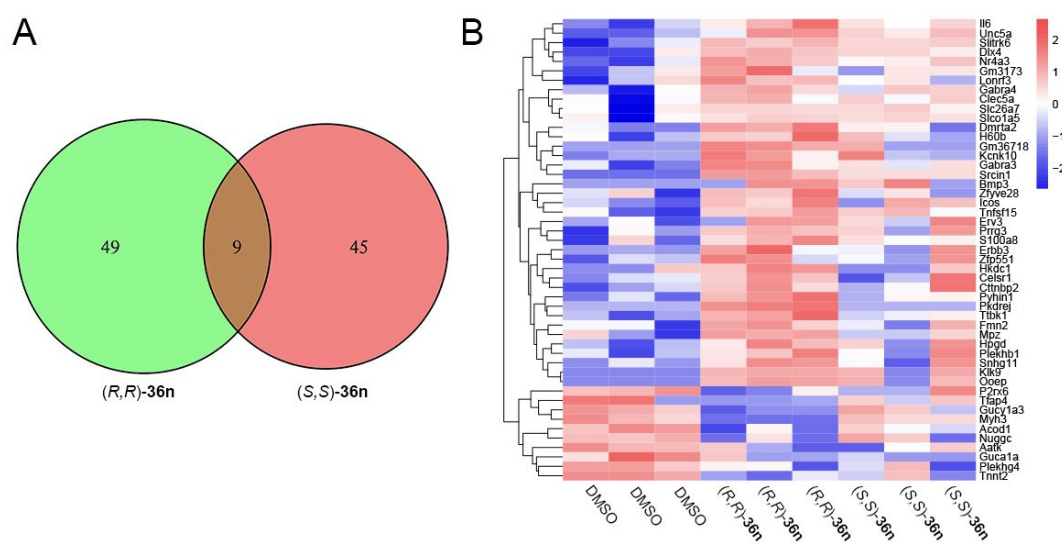

Figure 8. Effect of (*R,R*)-36n on global gene expression. (A) Venn diagram showing number of genes significantly up- or down-regulated greater than 1.5 fold ($p < 0.05$) following (*R,R*)-36n, (*S,S*)-36n or DMSO treatment for 48h in MEF cells. Green circle represents the number of influenced genes by (*R,R*)-36n relative to blank control, red circle means differential gene of (*S,S*)-36n relative to blank control. (B) Hierarchical

clustering heat map of selected genes showing differential regulation by (*R,R*)-**36n** and (*S,S*)-**36n** [genes up- or down-regulated by > 1.5-fold and $p < 0.05$ of (*R,R*)-**36n**]. Data from three donors are shown for each experiment.

2.8. A Preliminary Assessment for the Pharmacokinetic Properties of (*R,R*)-**36n**.

The pharmacokinetic characteristics of (*R,R*)-**36n** were assessed on rats. A dose of 10 mg/kg was administered through intravenous infusion or oral administration (for the blood concentration-time profiles, see Supporting Information Figure S3). The key oral administration pharmacokinetic parameters calculated are summarized in Table 4. The area under the concentration-time curve ($AUC_{0-\infty}$) is 2486 h·ng/mL. The half-life ($T_{1/2}$) and the maximum plasma concentration (C_{max}) are 1.51 h and 1418 ng/mL, respectively. Importantly, (*R,R*)-**36n** has an excellent bioavailability of 52%. In addition, the measured *in vitro* clearance of (*R,R*)-**36n** is 45 mL/min/kg in human liver microsomes (Supporting Information Table S5). The aqueous solubility and $\text{LogD}_{\text{pH}7.4}$ measured by HPLC are 480 μM and 1.9, respectively. Because it is the unbound drug that drives efficacy according to the free drug hypothesis, we thus determined the fraction unbound ($f_{u,b}$) in the Sprague-Dawley rat plasma, which gave an average value of 5.8%. All of these results indicate that (*R,R*)-**36n** possesses favorable pharmacokinetic properties.

Table 4. Key Pharmacokinetic Parameters of (*R,R*)-**36n** (p.o.).

Parameter	Value ^a
$T_{1/2}$ (h)	1.51 ± 0.23
T_{max} (h)	0.67 ± 0.29

C_{\max} (ng/mL)	1418 ± 252
$AUC_{(0-t)}$ (h·ng/mL)	2479 ± 399
$AUC_{(0-\infty)}$ (h·ng/mL)	2486 ± 403
F (%)	52 ± 8.3

^a Expressed as Mean ± SD, n = 3

3. CONCLUDING REMARKS

In this investigation, we discovered a potent PCAR BRD inhibitor, (*R,R*)-**36n**. This compound contains a new scaffold, pyrrolo[3,2-d]pyrimidin-4-one. Besides, it also contains a substituted piperidine, which is a common feature and presents in two other reported series of active compounds (**7** and **9** in Figure 1).^{23, 25} In addition to the PCAF inhibition, (*R,R*)-**36n** also showed activity against GCN5 and FALZ, but displayed very weak or no activity against other 29 BRDs and 422 kinases, indicating considerable selectivity. Interestingly, the enantiomer (*S,S*)-**36n** did not show activity against PCAF, implying that (*R,R*)-**36n** could be a very suitable probe in investigating the biologic functions of PCAF. RNA-seq analysis demonstrated that (*R,R*)-**36n** treatment affected the expression of 49 genes on MEF cells. However, the effects of the gene expression changes on biological functions are unknown, which needs further in-depth studies. Overall, we have obtained a potent and selective PCAF inhibitor. Nevertheless, the exploring of biological functions and medicinal applications of this compound still needs intensive studies.

4. EXPERIMENTAL PROCEDURES

4.1. Chemistry. All reagents and solvents were purchased from commercial suppliers without further purification unless otherwise indicated. All reactions were monitored

1
2
3
4 by thin-layer chromatography (TLC) and visualized with UV light, ninhydrin stain, or
5
6 iodine stain. Column chromatography was performed on pre-packed silica gel columns
7
8 using a Biotage Isolera One flash purification system (LPLC). HPLC was performed
9
10 on a Waters 2695 HPLC system. Gemini C18 reversed-phase column (4.6 mm Φ \times 150
11
12 mm, 5 μ m) was used for purity analysis, solubility and logD determinations and Daicel
13
14 Chiralpak IE chiral column (part no. 85325; 4.6 mm Φ \times 150 mm; 5 μ m) for
15
16 enantiomeric excess (*ee*) determination. ^1H NMR and ^{13}C NMR spectra were recorded
17
18 on a Bruker AV-400 spectrometer. Coupling constants (J) are expressed in hertz (Hz).
19
20 Chemical shifts are reported as parts per million (ppm) relative to an internal solvent
21
22 reference. The following abbreviations were used in the NMR descriptions: s, singlet;
23
24 d, doublet; t, triplet; q, quartet; m, multiplet; dd, double doublet; and br, broad peak.
25
26 High-resolution ESI-MS data were recorded on an Agilent 1200-G6410A mass
27
28 spectrometer. Purity of screening compounds were evaluated by NMR spectroscopy
29
30 and HPLC analysis. All compounds had purity $\geq 95\%$ by HPLC.

10 2.01 – 1.84 (m, 3H), 1.75 (q, *J* = 12.2 Hz, 1H).
11
12
13

14 *Step 3.* To a suspension of *N*-[(3*R*,5*R*)-1-methyl-5-phenylpiperidin-3-yl]pyridine-
15
16 2-carboxamide (2.8 g, 9.48 mmol) in *i*-PrOH (80 mL) was added NaOH (3.8 g, 95
17
18 mmol). The mixture was stirred at 85 °C for 18 h. Then the solvent was removed under
19
20 reduced pressure and water (50 mL) was added. The solution was extracted with EtOAc
21
22 (50 mL × 2). The combined organic layer was dried over anhydrous Na₂SO₄, filtered,
23
24 and added 15% HCl in ethanol (1 mL). Finally the solvent was removed in vacuo to
25
26 give (*R,R*)-**20a** (2.11 g, 85%, 8.0 mmol) as a pale-white solid. ¹H NMR (400 MHz,
27
28 DMSO-*d*₆) δ 11.78 (s, 1H), 8.80 (s, 3H), 7.44 – 7.21 (m, 5H), 3.81 – 3.70 (m, 1H), 3.64
29
30 – 3.56 (m, 1H), 3.54 – 3.46 (m, 1H), 3.37 – 3.26 (m, 1H), 3.25 – 3.05 (m, 2H), 2.84 (s,
31
32 3H), 2.28 (d, *J* = 12.3 Hz, 1H), 1.82 (q, *J* = 12.3 Hz, 1H).

2-chloro-3-ethyl-3H,4H,5H-pyrrolo[3,2-d]pyrimidin-4-one (27a). **27a** was prepared from **15** (2.0 g, 7.42 mmol) and iodoethane (1.5 g, 9.65 mmol) using the procedure described for **16** in 51% yield as a white solid. ¹H NMR (400 MHz, DMSO-*d*₆) δ 12.29 (s, 1H), 7.43 (t, *J* = 2.9 Hz, 1H), 6.35 (dd, *J* = 2.9, 2.0 Hz, 1H), 4.24 (q, *J* = 7.1 Hz, 2H), 1.26 (t, *J* = 7.1 Hz, 3H).

2-chloro-3-(prop-2-en-1-yl)-3H,4H,5H-pyrrolo[3,2-d]pyrimidin-4-one (27b). **27b** was prepared from **15** (2.0 g, 7.42 mmol) and 3-bromoprop-1-ene (1.17 g, 9.65 mmol) using the procedure described for **16** in 49% yield as a white solid. ¹H NMR (400 MHz, DMSO-*d*₆) δ 12.33 (s, 1H), 7.46 (t, *J* = 2.9 Hz, 1H), 6.38 (t, *J* = 2.4 Hz, 1H), 6.02 – 5.90 (m, 1H), 5.20 (dq, *J* = 10.5, 1.6 Hz, 1H), 5.02 (dq, *J* = 17.1, 1.7 Hz, 1H), 4.83 (dt, *J* = 4.9, 1.8 Hz, 2H).

3-(but-3-en-1-yl)-2-chloro-3H,4H,5H-pyrrolo[3,2-d]pyrimidin-4-one (27c).

27c was prepared from **15** (2.0 g, 7.42 mmol) and 4-bromobut-1-ene (1.30 g, 9.65 mmol) using the procedure described for **16** in 34% yield as a white solid. ¹H NMR (400 MHz, DMSO-*d*₆) δ 12.29 (s, 1H), 7.44 (t, *J* = 2.9 Hz, 1H), 6.35 (dd, *J* = 2.9, 2.0 Hz, 1H), 5.90 – 5.80 (m, 1H), 5.09 – 5.00 (m, 2H), 4.32 – 4.22 (m, 2H), 2.45 (q, *J* = 7.1 Hz, 2H).

3-(but-2-en-1-yl)-2-chloro-3H,4H,5H-pyrrolo[3,2-d]pyrimidin-4-one (27d).

27d was prepared from **15** (2.0 g, 7.42 mmol) and 1-bromobut-2-ene (1.30 g, 9.65 mmol) using the procedure described for **16** in 39% yield as a white solid. ¹H NMR (400 MHz, DMSO-*d*₆) δ 12.31 (s, 1H), 7.45 (t, *J* = 3.0 Hz, 1H), 6.36 (dd, *J* = 2.8, 2.0 Hz, 1H), 5.64 – 5.52 (m, 2H), 4.81 – 4.70 (m, 2H), 1.80 – 1.72 (m, 1H), 1.68 – 1.62 (m, 2H).

2-chloro-3,5-dimethyl-3H,4H,5H-pyrrolo[3,2-d]pyrimidin-4-one (28). NaH (60% in mineral oil, 400 mg, 10.0 mmol) was added portionwise to a stirred solution of **14** (1.2 g, 7.08 mmol) in anhydrous DMF (30 mL) at 0 °C. Twenty minutes later, iodomethane (2.27 g, 16.0 mmol) was added. The mixture was reacted at 60 °C for 5 h. After cooling to rt, the reaction mixture was diluted with water and extracted with EtOAc. The combined organic phase was concentrated under reduced pressure and the residue was purified by Biotage Isolera LPLC (PE/EA 10:1- 2:1) to give **28** (1.09 g, 78%) as a white solid. ¹H NMR (400 MHz, DMSO-*d*₆) δ 7.43 (d, *J* = 2.9 Hz, 1H), 6.30 (d, *J* = 2.9 Hz, 1H), 3.98 (s, 3H), 3.58 (s, 3H).

2-chloro-3-methyl-3H,4H-thieno[3,2-d]pyrimidin-4-one (31). *Step 1.* 2-chloro-3H,4H-thieno[3,2-d]pyrimidin-4-one **30** (1.73 g, 9.27 mmol, 95%) was prepared from **29** (2.0 g, 9.75 mmol) using the procedure described for **14** as a yellow solid.

1
2
3
4 Step 2. **31** (1.43 g, 77%) was prepared from **30** (1.73 g, 9.27 mmol) and
5
6 iodomethane (1.8 g, 12.7 mmol) using the procedure described for **28** as a yellow solid.
7

4 ***N*-[(3*R*,5*R*)-5-(2,3-dihydro-1,4-benzodioxin-6-yl)-1-methylpiperidin-3-**
5
6 **yl]pyridine-2-carboxamide ((*R,R*)-34m).** *Step 1.* To a stirred solution of (*R,R*)-33j
7
8 (2.3 g, 5.23 mmol) in DCM was added trifluoroacetic acid (4 mL). The resulting
9
10 mixture was stirred at ambient temperature for 4 h. Then the solvent was removed under
11
12 reduced pressure, and the crude product was redissolved in water (50 mL). The solution
13
14 was basified to pH 10 with 15% aq. NaOH and extracted with EtOAc (80 mL × 3). The
15
16 combined organic layer was dried over anhydrous Na₂SO₄, filtered, and concentrated
17
18 in vacuo to give *N*-[(3*R*,5*R*)-5-(2,3-dihydro-1,4-benzodioxin-6-yl)piperidin-3-
19
20 yl]pyridine-2-carboxamide (1.45 g, 4.27 mmol, 82%) as a pale-yellow solid, which was
21
22 used without further purification. ¹H NMR (400 MHz, DMSO-*d*₆) δ 8.68 – 8.59 (m,
23
24 1H), 8.45 (d, *J* = 8.7 Hz, 1H), 8.08 – 7.92 (m, 2H), 7.60 (ddd, *J* = 7.4, 4.8, 1.5 Hz, 1H),
25
26 6.76 (d, *J* = 8.1 Hz, 1H), 6.72 – 6.62 (m, 2H), 4.31 – 4.10 (m, 4H), 4.01 – 3.88 (m, 1H),
27
28 3.17 (d, *J* = 3.6 Hz, 1H), 3.07 – 2.95 (m, 1H), 2.94 – 2.84 (m, 1H), 2.69 – 2.58 (m, 1H),
29
30 2.48 – 2.38 (m, 2H), 2.33 (t, *J* = 11.7 Hz, 1H), 2.01 – 1.91 (m, 1H), 1.77 (q, *J* = 12.1

14 **4.2. Protein Expression and Purification.** For the isothermal-titration calorimetry
15 (ITC), thermal-shift assay (TSA), and crystallogenesi, human PCAF, GCN5, BRD4(1),
16
17 ATAD2, BAZ2B, BRD9, BRPF1, BRPF3, EP300, FALZ, TAF1(1), and TRIM24
18
19 bromodomains were expressed and purified according to the protocols previously
20
21 described.¹ All proteins were expressed as *N*-terminal His-tagged fusions and purified
22
23 using Ni-chelating affinity chromatography. Then these proteins were purified by gel
24
25 filtration using Superdex200 column, eluted with buffer containing 10 mM HEPES pH
26
27 7.5 and 500 mM NaCl, concentrated to 3 mg/mL, and frozen at -80 °C for thermal shift
28
29 assays. PCAF and GCN5 BRDs were further treated with TEV protease at 4°C
30
31 overnight to cleave *N*-terminal His-tag. The two proteins were then purified by gel
32
33 filtration chromatography (Superdex 200; GE-Healthcare), concentrated to 12 mg/mL,
34
35 flash-frozen in liquid nitrogen, and stored at -80 °C for ITC assays and crystallogenesi.
36
37
38
39
40
41
42
43
44

45 For the homogeneous time-resolved fluorescence (HTRF) experiments, GST-
46
47 tagged PCAF was cloned into pET28a vector and overexpressed in Escherichia coli
48
49 Rosetta (DE3). Purification was carried on GST-affinity resin (Thermo Scientific), and
50
51 reduced glutathione was used for protein release. GST-PCAF was further purified by
52
53 gel filtration chromatography on a Superdex 200 column (GE Healthcare) using a
54
55 buffer of 25 mM HEPES (pH 7.5) and 300 mM NaCl.
56
57
58
59
60

1
2
3 **4.3. Thermal-Shift Assay (TSA).** The TSA experiments were performed at least
4 in duplicate. Proteins were prepared in 10 mM HEPES pH 7.5, 500 mM NaCl, and
5 assayed in low-profile PCR tubes (Bio-Rad, TLS0851) at a final concentration of 2 μ M
6 in 20- μ L volume. Compounds were added at a final concentration of 10 μ M (final
7 concentration 0.1% DMSO). SYPRO Orange dye (Thermo Fisher Scientific) was added
8 at a dilution of 1:1000. The thermal melting experiments were carried using a Bio-Rad
9 CFX96 RT-PCR system. The tubes were first equilibrated at 25 °C for 3 min, then the
10 tubes were heated from 25 to 95 °C with a step of 1 °C/min. Raw fluorescence data
11 were recorded using CFX Maestro, melting temperature shifts were calculated as
12 previously described.³⁴

13
14
15 **4.4. Isothermal-Titration Calorimetry (ITC).** ITC was used to evaluate the
16 thermodynamics parameters of the binding between PCAF bromodomain and all the
17 final compounds. Titrations were carried out on a MicroCal ITC200 microcalorimeter
18 (Malvern Instruments). All experiments were carried out at 25 °C in 25 mM HEPES
19 (pH 7.5), 300 mM NaCl, 0.5 mM TCEP. Compounds were diluted directly in the same
20 batch buffer prior to experiments. Each experiment was designed as reverse titrations
21 experiments (protein in the syringe and ligand in the cell) using an initial injection of
22 0.4 μ L followed by 19 injections of 2 μ L. The first injection (generally 0.4 μ L) was
23 included in the titration protocol in order to remove air bubbles trapped in the syringe
24 prior to the titration. Background dilution heat was subtracted from each experiment.
25 Thermodynamic parameters were calculated using $\Delta G = \Delta H - T\Delta S = -RT\ln K_A$, where
26 $K_D = 1/K_A$. ΔG , ΔH and ΔS are changes in free energy, enthalpy and entropy
27 respectively. Independent single site binding models were employed in data analysis.

28
29 **4.5. Homogeneous Time-Resolved Fluorescence (HTRF).** HTRF assay was
30 carried out using a Cisbio EPIgeneous Binding Domain Kit B (62BDBPEG) using the

60

1
2
3 standard assay protocol with GST-PCAF BRD and biotinylated substrate **46**. The
4
5 protein GST-PCAF BRD was produced and purified in house. The biotinylated
6
7 substrate **46** was a kind gift from Prof. Dr. P. E. Brennan (Oxford University). The IC₅₀
8
9 measurements were performed in duplicate. 4 uL GST-PCAF BRD (100 nM), 2 uL
10
11 tested compounds, 4 uL compound **46** (500 nM), 5 uL SA-XL665 (250 nM), and 5 uL
12
13 1×GST Ab-Eu³⁺ were added into a 96-well low-volume plate (Cisbio 66PL96025), then
14
15 the plate was sealed and incubated at room temperature for 15 hours. Readings were
16
17 recorded using Cytation Hybrid Multi-Mode Reader with an excitation filter at 337 nm
18
19 and fluorescence measurement at 620 and 665 nm (60 μs integration delay and 400 μs
20
21 integration time). The IC₅₀ values were normalized and fitted with Prism 7.
22
23
24
25

26
27 **4.6. BROMOscan.** Bromodomain profiling was provided by DiscoverX Corp.
28
29 using their BROMOscan platform (<http://www.discoverx.com/>).³⁵ (*R,R*)-**36n** was
30
31 profiled at 1 μM against 32 recombinant bromodomains.
32
33

34
35 **4.7. Eurofins KinaseProfiler.** Kinase profiling was performed by Eurofins
36
37 (Dundee, U. K., <https://www.eurofins.com/>). (*R,R*)-**24a**, *endo*-**24c** and (*R,R*)-**36n** were
38
39 profiled at a single concentration of 10 μM against a panel of 422 kinases.
40
41

42
43 **4.8. Crystallization and Structure Determination.** PCAF and GCN5 BRDs were
44
45 crystallized by vapor diffusion in sitting drops. For PCAF, crystals grew in a mixture
46
47 of 1 μL protein solution at 16 mg/ml (25 mM HEPES, pH 7.5, 300 mM NaCl, 0.5 mM
48
49 TCEP) and 1 μL reservoir solution (100 mM HEPES pH 8.2, 26% PEG10000 (v/v), 4%
50
51 glycol) at 4 °C. Then overnight soaking of compound **12** was performed. For GCN5,
52
53 crystals with compound (*R,R*)-**36n** were grown by mixing 1 μL of the protein (12
54
55 mg/mL and 4 mM final ligand concentration) with an equal volume of reservoir solution
56
57 containing 0.2 M ammonium acetate, 0.1 M Tris pH 8.5, 25% w/v polyethylene glycol
58
59
60

1
2
3 3350 at 20 °C. Diffraction quality crystals grew within 5-7 days. All crystals were
4
5 cryoprotected with reservoir solution supplemented with 20% glycerol (v/v) before
6
7 being plunge-frozen in liquid nitrogen.
8

9
10 Diffraction data were collected at the Shanghai Synchrotron Light Source
11
12 (Shanghai, China). Data were indexed, integrated and scaled using HKL2000³⁶ or
13
14 XDS.³⁷ Structures were solved by molecular replacement with Phaser³⁸ using 5mkx.pdb
15
16 as template for PCAF bromodomain and 5mlj.pdb as template for GCN5 bromodomain.
17
18 Initial models were refined alternating cycles of automatic refinement with
19
20 Phenix.refine^{39, 40} and manual model building with WinCOOT 0.8.9.⁴¹ The structure
21
22 figures were prepared using Pymol. For the data collection and refinement statistics,
23
24 see Supporting Information Table S4.
25
26
27

28
29 **4.9. NanoBRET.** HEK293T cells (4×10^5 /ml) were plated in 6-well plate and co-
30
31 transfected with Histone H3.3-Halotag and PCAF-Nanoluciferase (Promega). Twenty
32
33 hours after transfection, cells were digested, collected and exchanged into Phenol red-
34
35 free DMEM containing 4% FBS. Cell density was adjusted to 2×10^5 /ml and then re-
36
37 plated into a 96-well assay white plate (Corning Costar #3917) in the absence (blank
38
39 control) or the presence of 100 nM NanoBRET 618 fluorescent ligand (Promega
40
41 N1661). Compounds or DMSO (vehicle control) were diluted using media and then
42
43 added into a 96-well plate at indicated concentrations. After that, the 96-well plate was
44
45 incubated for 18 h at 37 °C in the presence of 5% CO₂. NanoBRET Nano-Glo substrate
46
47 (Promega N1661) was diluted 100 times using media and then added 25 μL to each
48
49 sample well. Readings were recorded within 10 minutes using Thermo Scientific
50
51 Varioskan LUX equipped with 460/80 nm bandpass and 610 nm longpass filter module.
52
53 The corrected BRET ratio was calculated as the following formula: NanoBRET
54
55 corrected ratio = Ligand (610 nm/460 nm) – blank control (610 nm/460 nm) BRET
56
57
58
59
60

1
2
3 ratios are expressed as milliBRET units (mBU), where 1 mBU corresponds to the
4
5 corrected BRET ratio multiplied by 1000.
6

7
8 **4.10. RNA-seq.** Total RNA was extracted using the TRIzol reagent according to
9
10 the manufacturer's protocol. RNA purity and quantification were evaluated using a
11
12 NanoDrop 2000 spectrophotometer (Thermo Scientific, USA). RNA integrity was
13
14 assessed using the Agilent 2100 Bioanalyzer (Agilent Technologies, Santa Clara, CA,
15
16 USA). Then the libraries were constructed using TruSeq Stranded mRNA LT Sample
17
18 Prep Kit (Illumina, San Diego, CA, USA) according to the manufacturer's instructions.
19
20 The transcriptome sequencing and analysis were conducted by OE Biotech Co., Ltd.
21
22 (Shanghai, China).
23
24

25
26 The libraries were sequenced on an Illumina HiSeq X Ten platform and 150 bp
27
28 paired-end reads were generated. Raw data (raw reads) of fastq format were firstly
29
30 processed using Trimmomatic. After removing low quality reads and reads containing
31
32 adapter or poly-N from raw data, the clean reads were mapped to the human genome
33
34 using HISAT2.
35
36

37
38 FPKM value of each gene was calculated using Cufflinks, and the read counts of
39
40 each gene were obtained by HTSeq-count. Differential expression analysis was
41
42 performed using the DESeq (2012) R package. P value < 0.05 and fold change > 1.5 or
43
44 < 1/1.5 was set as the threshold for significantly differential expression.
45
46

47
48 **4.11. Microsomal Stability Assay.** (*R,R*)-**36n** (1 μ M) was incubated with 0.5
49
50 mg/mL human liver microsomes. NADPH was maintained at 1 mM in 1000 μ L of
51
52 reaction volume. The reaction was then evaluated at 0, 5, 15, 30, and 45 min and was
53
54 terminated by the addition of acetonitrile. Samples were centrifuged for 15 min at 6000
55
56
57
58
59
60

rpm and the supernatant analyzed using LC-MS. Percentage parent remaining was calculated considering percent parent area at 0 min as 100%.

4.12. Plasma protein binding. Plasma protein binding was measured using previously published protocol.⁴²

4.13. Rats pharmacokinetic studies. Animal studies were conducted under the approval of the Experimental Animal Management Committee of Sichuan University. The pharmacokinetics analysis of (*R,R*)-**36n** was conducted in male Sprague–Dawley rats. The 6 to 8 week old Sprague-Dawley rats were treated with a single dose of (*R,R*)-**36n** at 10 mg/kg by intravenous tail vein injection and oral gavage administration (2.5% (v/v) ethanol and 2.5% tween-80 in saline, pH 7.0). Serial blood samples (200 μ L) were collected from jugular vein at designated times. Blood samples were put on ice and centrifuged to obtain plasma samples (6800 \times g, 6 min under 4 $^{\circ}$ C) within 2 hours. All blood samples were stored at approximately at -80 $^{\circ}$ C until analysis.

The blood samples were prepared for analysis by placing a 20 μ L aliquot into a 96-well plate followed by the addition of 400 μ L MeOH of acetonitrile containing 100 ng/mL IS. The mixture was vortexed for 1 min and centrifuged at 18000 \times g for 7 min. An aliquot of 1 μ L supernatant was injected for LC-MS/MS analysis. Noncompartmental pharmacokinetic parameters were fitted using DAS software (Enterprise, version 2.0, Mathematical Pharmacology Professional Committee of China).
